

Embroider designs of FSL flowers on two layers of a water-soluble stabilizer. If your water-soluble stabilizer has a high density, then you can embroider on one layer. The stabilizer should be well stretched in the hoop, not having waves on the surface.

This design is embroidered on water-soluble stabilizer. The stabilizer is washed, dried and petals are formed. If you wash the parts of the flower in hot water, the petals curl up a little and this gives them a natural look. Do not straighten the petals so that they dry with natural curves

All parts of the flower are sewn by hand in the center. You can also decorate the middle of the flower with beads or rhinestones.
