

FSL decorations are embroidered on a dense water-soluble stabilizer such as Vilene 105. If your water-soluble stabilizer has a high density, then you can embroider on one layer.

After the products are embroidered, the water-soluble stabilizer should be washed.

If it is a brooch or other product that must be tough and keep in shape, do not wash away the highly water-soluble stabilizer.

The product must then be dried. Sometimes you can use an iron, you need to put under the product and top a terry towel and iron it.

Then, according to your taste, the product can be decorated with beads, sequins, paillettes. And add hardware.
